## Worksheet 8 on Chapter 4: Gases

## I. Gas Laws

1. A sample of oxygen gas at $30^{\circ} \mathrm{C}$ fills a 50 L volume. If the temperature is raised to $50^{\circ} \mathrm{C}$ and the pressure is held constant, what volume will the same sample occupy?
2. What is the density of a gas if 0.036 moles of it occupy 3 L and its molecular weight is $75 \mathrm{~g} / \mathrm{mol}$ ?
3. Under a pressure of 1.7 atm a $\mathrm{N}_{2}$ sample occupies 35 mL . If the temperature does not change, at what pressure will the sample occupy 20 mL ?
4. Calculate the volume of $\mathrm{CO}_{2}$ at $25^{\circ} \mathrm{C}$ and 1 atm that plants need to make 1 gram of glucose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}\right)$ by photosynthesis, assuming the reaction: $6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2}$
5. 5.0 mol of a gas with a density of $1.23 \mathrm{~g} / \mathrm{L}$ take up 10.0 L . What is its molecular weight?
6. Given that a gas is at $1 \mathrm{~atm}, 273 \mathrm{~K}$, and takes up 2.5 L , how many molecules of the gas are present?

## II. Kinetic Molecular Theory

Indicate whether, according to kinetic molecular theory, the statement is true (T) or false (F).

1. When gas molecules collide with their container, they transfer energy to it that is $\mathrm{T} \quad \mathrm{F}$ proportional to their velocity.
2. Gas molecules of different compounds have the same average kinetic energy at the $\mathrm{T} \quad \mathrm{F}$ same temperature.
3. Gas molecules of different compounds have the same average velocity at the same $\mathrm{T} \quad \mathrm{F}$ temperature.
4. When two gas molecules collide, they don’t usually form a new compound. $\mathrm{T} \quad \mathrm{F}$
5. Gas molecules aren't very attracted to one another under standard conditions. $\mathrm{T} \quad \mathrm{F}$
6. A pure sample of gas molecules will have the same average kinetic energy at all $\mathrm{T} \quad \mathrm{F}$ temperatures and pressures.
7. The average kinetic energy of a gas molecule depends on both the surrounding $\mathrm{T} \quad \mathrm{F}$ temperature and the molecular weight.

## III. Diffusion/Effusion

1. The larger the gas molecule, the slower the rate of its diffusion. $\mathrm{T} \quad \mathrm{F}$
2. A smell spreading through a room is an example of effusion. $\mathrm{T} \quad \mathrm{F}$
3. Rates of diffusion depend on the molecular weight of the gas. $\mathrm{T} \quad \mathrm{F}$

## IV. Velocities of Gases

Calculate the average velocities of the molecules in the following gases and put them in order from slowest to fastest.
(a) $\mathrm{CO}_{2}$
(b) He
(c) $\mathrm{N}_{2}$
(d) $\mathrm{C}_{2} \mathrm{H}_{2}$

Ranking: slowest fastest

## V. Non-ideal Gases

1. Why would the ideal gas law be a better approximation for $\mathrm{N}_{2}$ gas and Ne gas than for $\mathrm{CH}_{3} \mathrm{OH}$ gas?
2. Using the non-ideal gas equation, $\left(P+n^{2} a / V^{2}\right)(V-n b)=n R T$, what would be the exact volume of 1.0 mol of $\mathrm{H}_{2}$ gas at 273 K and 1.0 atm , given that the non-ideal corrections for $\mathrm{H}_{2}$ are $\mathrm{a}=0.244$ and $\mathrm{b}=0.266$ ?
