Which one of the following statements is true?

1. Labile is a term that refers to the thermodynamic tendency of a substance to decompose.
2. A thermodynamically unstable compound is a compound with a positive standard free energy of formation. correct
3. Spontaneous reactions always have $\Delta S_{\mathrm{r}}^{\circ}>0$.
4. Spontaneous reactions always have $\Delta G_{\mathrm{r}}^{\circ}>0$.
5. Spontaneous reactions always have $\Delta H_{\mathrm{r}}^{\circ}<0$.

## Explanation:

## ACAMP FE 0005

15:12, general, multiple choice, $>1$ min, fixed. 003
In order for an endothermic reaction to be spontaneous

1. the entropy increase in the system must be greater than the entropy decrease in the surroundings. correct
2. nothing special is required; they are always spontaneous.
3. heat must be supplied to the system.
4. endothermic reactions are never spontanteous.
5. the entropy increase in the system must equal the entropy decrease in the surroundings.

## Explanation:

The Second Law of Thermodynamics states that in spontaneous reactions, the universe tends toward a state of greater disorder. When the entropy increase in the system is greater than the entropy decrese in the surroundings, the entropy of the universe will increase.

## Msci 151212

15:12, general, multiple choice, $>1 \mathrm{~min}$, fixed.

## 004

Which one of the following statements is the best statement of the Second Law of Thermodynamics?

1. The absolute entropy of a perfect crystal at 0 K would be 0 .
2. For any spontaneous process, the entropy of the system must increase.
3. For any reversible process, the entropy change of the universe must be positive.
4. For any spontaneous process, the total
entropy of the universe must increase. correct
5. For any spontaneous process, the change in entropy of the universe must be negative.

## Explanation:

The Second Law of Thermodynamics states that in spontaneous changes, the universe tends toward a state of greater disorder.

## Msci 151223

15:13, basic, multiple choice, $>1 \mathrm{~min}$, fixed. 005
Which of the following is the best definition of entropy?

1. Entropy is a state function such that a change in entropy is given by the flow of heat into a system in a reversible process divided by the temperature at which it occurs. correct
2. Entropy is a state function that is directly proportional to the degree of order in the system.
3. Entropy is a state function that is directly proportional to the logarithm of the degree of order in the system.
4. Entropy is the change in Gibbs free energy during a process divided by the temperature at which it occurs.
5. Entropy is a state function which achieves a maximum value when a reversible reaction comes to equilibrium.

## Explanation:

The units of entropy are

$$
\frac{\text { Heat }}{\text { Temperature }}=\frac{\mathrm{J}}{\mathrm{~mol} \cdot \mathrm{~K}}, \frac{\mathrm{cal}}{\mathrm{~g} \cdot \mathrm{~K}} \text {, etc. }
$$

Entropy is a state function, so $\Delta S=S_{\mathrm{f}}-S_{\mathrm{i}}$.

## ChemPrin3e T07 40

## 006

Calculate $\Delta S_{\text {surr }}^{\circ}$ at 298 K for the reaction

$$
6 \mathrm{C}(\mathrm{~s})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{C}_{6} \mathrm{H}_{6}(\ell)
$$

$$
\Delta H_{\mathrm{r}}^{\circ}=+49.0 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1} \text { and } \Delta S_{\mathrm{r}}^{\circ}=-253
$$

$$
\mathrm{J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}
$$

$$
\text { 1. }+164 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}
$$

$$
\text { 2. }-417 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}
$$

$$
\text { 3. }+253 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}
$$

$$
\text { 4. }-164 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1} \text { correct }
$$

$$
\text { 5. }-253 \mathrm{~J} \cdot \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}
$$

## Explanation:

$$
007
$$

What is the change in entropy when one mole of methane $\left(\mathrm{CH}_{4}\right)$ is frozen to a solid at its normal melting point of $-182^{\circ} \mathrm{C}$ ?

The heat of fusion of $\mathrm{CH}_{4}$ is $0.92 \mathrm{~kJ} / \mathrm{mol}$. (Careful - watch your signs.)

1. $10.1 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}$
2. $-10.1 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}$ correct
3. $5.05 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}$
4. $-5.05 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}$
5. None of these

## Explanation:

$\Delta H=0.92 \mathrm{~kJ} / \mathrm{mol}$
$T=-182^{\circ} \mathrm{C}+273=91 \mathrm{~K}$

$$
\frac{0.92 \mathrm{~kJ} / \mathrm{mol}}{91 \mathrm{~K}}=0.0101099 \frac{\mathrm{~kJ}}{\mathrm{~K} \cdot \mathrm{~mol}}
$$

Freezing increases the order of the system, so the entropy change is $-10.1099 \frac{\mathrm{~J}}{\mathrm{~K} \cdot \mathrm{~mol}}$.

14:01, general, multiple choice, $>1 \mathrm{~min}$, fixed.

## 011

Water causes many electrolytes to dissociate

1. because water molecules are dipoles and the dipoles orient in an energetically favorable manner to solvate the ions. correct
2. because it undergoes hydrogen bonding to large halide ions.
3. because the dispersion forces between ion and solvent are strong.
4. because of repulsive interactions between ions in the crystalline state.

## Explanation:

The more negative end of the water molecule orients toward the cation and the more positive end orients toward the anion; the ions remain apart.

The specific heat of water is $1.00 \mathrm{cal} / \mathrm{g} \cdot{ }^{\circ} \mathrm{C}$, the heat of vaporization of water is $540 \mathrm{cal} / \mathrm{g}$, and the heat of fusion of water is $80 \mathrm{cal} / \mathrm{g}$.

How much heat would be required to convert 10 grams of ice at $0^{\circ} \mathrm{C}$ to 10 grams of water at $75^{\circ} \mathrm{C}$ ?

1. 1.55 kcal correct
2. 155 cal
3. 15.5 cal
4. 61.5 kcal
5. 6150 cal

## Explanation:

$$
\underset{\substack{10 \mathrm{~g} \\
\mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) \\
0^{\circ} \mathrm{C}}}{\text { step } 1} \underset{\longrightarrow}{10 \mathrm{~g}} \underset{\mathrm{H}_{2} \mathrm{O}(\ell)}{\mathrm{H}^{\circ} \mathrm{C}} \stackrel{\text { step } 2}{ } \xrightarrow{10 \mathrm{~g}} \begin{gathered}
\mathrm{H}_{2} \mathrm{O}(\ell) \\
75^{\circ} \mathrm{C}
\end{gathered}
$$

$$
\begin{aligned}
& \text { Step 1: } \frac{80 \mathrm{cal}}{\mathrm{~g}}(10 \mathrm{~g})=800 \mathrm{cal} \\
& \text { Step 2: } \frac{1 \mathrm{cal}}{\mathrm{~g} \cdot{ }^{\circ} \mathrm{C}}(10 \mathrm{~g})(75-0)^{\circ} \mathrm{C}=750 \mathrm{cal} \\
& \begin{aligned}
\text { Total } & =800 \mathrm{cal}+750 \mathrm{cal} \\
& =1550 \mathrm{cal} \\
& =1.55 \mathrm{kcal}
\end{aligned}
\end{aligned}
$$

## Mlib 044013

14:01, general, multiple choice, $>1$ min, fixed. 015
For gases that do not react chemically with water, the solubility of the gas in water generally (decreases, increases) with an increase in the pressure of the gas and (decreases, increases) with increasing temperature.

1. increases; decreases correct
2. decreases; increases
3. increases; increases

## 4. decreases; decreases

## Explanation:

An increase in pressure means that you have increased the concentration of gas above the solvent surface, thereby increasing the concentration of the gas in the solvent. Increasing the temperature will decrease the solubility of the gas.

## Msci 145001

14:01, general, multiple choice, $>1$ min, fixed. 016
Which one of the following statements is false?

1. Carbon tetrachloride $\left(\mathrm{CCl}_{4}\right)$ is more miscible with hexane $\left(\mathrm{C}_{6} \mathrm{H}_{14}\right)$ than it is with a polar solvent such as methanol $\left(\mathrm{CH}_{3} \mathrm{OH}\right)$.
2. Gases are generally more soluble in water under high pressures than under low pressures.
3. As temperature increases, the solubilities of some solids in liquids increase and the solubilities of other solids in liquids decrease.
4. Gases are generally more soluble in water at high temperatures than at low temperatures. correct
5. Water dissolves many ionic solutes because of its ability to hydrate ions in solution.

## Explanation:

The polarity of water allows it to hydrate the individual ions in the ionic solute.
$\mathrm{CCl}_{4}$ is non-polar and will be miscible with another non-polar liquid and not with a polar one.

Increasing temperature makes salts with exothermic $\Delta H_{\text {sol }}$ more soluble, but salts with endothermic $\Delta H_{\text {sol }}$ less soluble.

Gases are generally more soluble in water under high pressures than under low pressures because of Henry's Law; as the pressure of a gas above a liquid increases, the concentration of the gas in the solution increases.

## Mlib 750163

14:01, general, multiple choice, $>1$ min, fixed. 017
Which of the following is likely to be LEAST soluble in water?

1. $\mathrm{C}_{6} \mathrm{H}_{6}$ (benzene). correct
2. $\mathrm{CH}_{3} \mathrm{OH}$ (methanol).
3. $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ (glucose).
4. HCHO (formaldehyde).

## Explanation:

## Msci 140901

14:05, general, multiple choice, $>1$ min, fixed. 018
The vapor pressure of a volatile component in a solution decreases as its mole fraction decreases.

This is known as

1. Raoult's Law. correct
2. Henry's Law.
3. Bragg's Law.

## 4. LeChatelier's Principle.

## Explanation:

According to Raoult's Law, the vapor pressure of the volatile component of a solution equals its mole fraction in the solution times the vapor pressure of the pure solvent.

$$
P=X P^{0}

Calculate the vapor pressure at $25^{\circ} \mathrm{C}$ of a mixture of benzene and toluene in which the mole fraction of benzene is 0.650 . The vapor pressure at $25^{\circ} \mathrm{C}$ of benzene is 94.6 torr and that of toluene is 29.1 torr.

1. 84.4 torr
2. 124 torr
3. 51.3 torr
4. 71.7 torr correct
5. 61.5 torr

## Explanation:

## ChemPrin3e T08 09

14:05, basic, multiple choice, $<1 \mathrm{~min}$, fixed. 020
The vapor pressure of water at $37^{\circ} \mathrm{C}$ is 47.1 torr and its enthalpy of vaporization is 44.0 $\mathrm{kJ} \cdot \mathrm{mol}^{-1}$.

Estimate the vapor pressure of water at $87^{\circ} \mathrm{C}$. Assume the enthalpy of vaporization of water is independent of temperature.
4. 52 torr
5. 504 torr correct

## Explanation:

## Holt da 14 rev 35

14:07, highSchool, numeric, $>1$ min, fixed.

## 021

Consider 0.01 m aqueous solutions of each of the following.
a) NaI ;
b) $\mathrm{CaCl}_{2}$;
c) $\mathrm{K}_{3} \mathrm{PO}_{4}$; and
d) $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ (glucose)

Arrange the solutions in order of freezing point from lowest to highest. Assume that each compound behaves ideally.

1. d, a, b, c
2. a, b, c, d
3. d, c, b, a
4. $\mathrm{c}, \mathrm{b}, \mathrm{a}, \mathrm{d}$ correct
5. a, d, b, c
6. $c, b, d, a$
7. b, a, d, c
8. c, d, a, b
9. None of these

## Explanation:

solvent is $\mathrm{H}_{2} \mathrm{O}$
$m=0.01 \mathrm{~m}$
solutes are $\mathrm{NaI}, \mathrm{CaCl}_{2}, \mathrm{~K}_{3} \mathrm{PO}_{4}, \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$
FP depression of each solution $=$ ?

$$
\Delta t_{\mathrm{f}}=K_{\mathrm{f}} m
$$

a) For the solute NaI ,

$$
\mathrm{NaI}(\mathrm{~s}) \longrightarrow \mathrm{Na}^{+}+\mathrm{I}^{-}(\mathrm{aq})
$$

each formula unit of NaI yields two ions in solution:

$$
\begin{aligned}
\Delta t_{\mathrm{f}}= & \frac{-1.86^{\circ} \mathrm{C} \cdot \mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O}}{\mathrm{~mol} \text { ions }} \cdot \frac{0.01 \mathrm{~mol} \mathrm{NaI}}{\mathrm{~kg} \mathrm{H}_{2} \mathrm{O}} \\
& \cdot \frac{2 \mathrm{~mol} \mathrm{ions}}{\mathrm{~mol} \mathrm{NaI}} \\
= & -0.04^{\circ} \mathrm{C}
\end{aligned}
$$

b) For the solute $\mathrm{CaCl}_{2}$,

$$
\mathrm{CaCl}_{2}(\mathrm{~s}) \longrightarrow \mathrm{Ca}^{2+}+2 \mathrm{Cl}^{-}(\mathrm{aq})
$$

each formula unit of $\mathrm{CaCl}_{2}$ yields three ions in solution:

$$
\begin{aligned}
\Delta t_{\mathrm{f}}= & \frac{-1.86^{\circ} \mathrm{C} \cdot \mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O}}{\mathrm{~mol} \text { ions }} \cdot \frac{0.01 \mathrm{~mol} \mathrm{CaCl}_{2}}{\mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O}} \\
& \cdot \frac{3 \mathrm{~mol} \mathrm{ions}}{\mathrm{~mol} \mathrm{CaCl}_{2}} \\
= & -0.06^{\circ} \mathrm{C}
\end{aligned}
$$

c) For the solute $\mathrm{K}_{3} \mathrm{PO}_{4}$,

$$
\mathrm{K}_{3} \mathrm{PO}_{4}(\mathrm{~s}) \longrightarrow 3 \mathrm{~K}^{+}+\mathrm{PO}_{4}^{3-}(\mathrm{aq})
$$

each formula unit of $\mathrm{K}_{3} \mathrm{PO}_{4}$ yields four ions in solution:

$$
\begin{aligned}
\Delta t_{\mathrm{f}}= & \frac{-1.86^{\circ} \mathrm{C} \cdot \mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O}}{\mathrm{~mol} \text { ions }} \cdot \frac{0.01 \mathrm{~mol} \mathrm{~K}_{3} \mathrm{PO}_{4}}{\mathrm{~kg} \mathrm{H}_{2} \mathrm{O}} \\
& \cdot \frac{4 \mathrm{~mol} \mathrm{ions}}{\mathrm{~mol} \mathrm{~K}_{3} \mathrm{PO}_{4}} \\
= & -0.07^{\circ} \mathrm{C}
\end{aligned}
$$

d) For the solute $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ (glucose),

$$
\begin{aligned}
\Delta t_{\mathrm{f}}= & \frac{-1.86^{\circ} \mathrm{C} \cdot \mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O}}{\mathrm{~mol} \text { ions }} \cdot \frac{0.01 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}}{\mathrm{~kg} \mathrm{H}_{2} \mathrm{O}} \\
& \cdot \frac{1 \mathrm{molions}}{\mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}} \\
= & -0.02^{\circ} \mathrm{C}
\end{aligned}
$$

Arranging these from lowest to highest,

$$
-0.07^{\circ} \mathrm{C}<-0.06^{\circ} \mathrm{C}>-0.04^{\circ} \mathrm{C}<-0.02^{\circ} \mathrm{C}
$$

so the order of increasing $\Delta t_{\mathrm{f}}$ is $\mathrm{c}, \mathrm{b}, \mathrm{a}, \mathrm{d}$.

How many grams of methanol $\left(\mathrm{CH}_{3} \mathrm{OH}\right)$ are needed to lower the freezing point of 400 mL of water by $2.5^{\circ} \mathrm{C}$ ? ( $K_{\mathrm{f}}$ water $=$ $1.86^{\circ} \mathrm{C} /$ molality)

## 1. 17.2 correct

2. 18.3
3. 21.8
4. 9.71
5. 12.8

## Explanation:

$K_{\mathrm{f} \mathrm{H}_{2} \mathrm{O}}=1.86^{\circ} \mathrm{C} / m \quad V_{\text {water }}=400 \mathrm{~L}$
FP depression $=2.5^{\circ} \mathrm{C}$

$$
\begin{aligned}
& \Delta T_{\mathrm{f}}=K_{\mathrm{f}} \cdot m \\
& m=\frac{\Delta T_{\mathrm{f}}}{K_{\mathrm{f}}}=\frac{2.5^{\circ} \mathrm{C}}{1.86^{\circ} \mathrm{C} / m}=1.344 \mathrm{~m} \\
& \mathrm{~m}_{\mathrm{H}_{2} \mathrm{O}}=400 \mathrm{~mL} \times \frac{1.00 \mathrm{~g}}{\mathrm{~mL}} \times \frac{10^{-3} \mathrm{~kg}}{\mathrm{~g}} \\
& =0.4 \mathrm{~kg} \mathrm{H} \mathrm{H}_{2} \mathrm{O} \\
& m=\frac{n_{\mathrm{CH}_{3} \mathrm{OH}}}{\mathrm{~kg} \text { water }}=\frac{\frac{\mathrm{g} \mathrm{CH}_{3} \mathrm{OH}}{\mathrm{MW}_{\mathrm{CH}_{3} \mathrm{OH}}}}{\mathrm{~kg} \text { water }} \\
& \mathrm{g} \mathrm{CH}_{3} \mathrm{OH}=m(\mathrm{~kg} \text { water })\left(\mathrm{MW}_{\mathrm{CH}_{3} \mathrm{OH}}\right) \\
& =\left(\frac{1.344 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{OH}}{\mathrm{~kg} \text { water }}\right) \\
& \times(0.400 \mathrm{~kg} \text { water }) \\
& \times\left(\frac{32.0 \mathrm{~g} \mathrm{CH}_{3} \mathrm{OH}}{\mathrm{~mol} \mathrm{CH}_{3} \mathrm{OH}}\right) \\
& =17.2 \mathrm{~g} \mathrm{CH}_{3} \mathrm{OH}
\end{aligned}
$$

023
Many biological cells are killed if they are placed in pure water because

1. if nothing can pass through the cell wall, the greater pressure inside than outside causes the cell to burst open.
2. if nothing can pass through the cell wall, the greater pressure outside than inside causes the cell to collapse.
3. vital cell constituents dissolved in the cell fluid pass through the cell wall causing the cells to die.
4. the water in the cells passes out through the cell wall causing the cell to shrivel and die.
5. more water passes in through the cell wall than passes out so the cells swell and burst. correct

## Explanation:

More solvent molecules pass through the semi-permeable cell membrance into the cell where the solvent concentration is low than in the other direction. This process coninues until pressure on both sides of the membrane is equal or until the cell from the large volume of excess water that enters.

What is the equilibrium expression for the following equation?

$$
\mathrm{A}+2 \mathrm{~B} \rightleftharpoons 3 \mathrm{C}+\mathrm{D}
$$

Assume that all species here are gases.

1. $\frac{[\mathrm{C}]^{3}[\mathrm{D}]}{[\mathrm{A}][\mathrm{B}]^{2}}$ correct
2. $\frac{[\mathrm{A}][\mathrm{B}]^{2}}{[\mathrm{C}]^{3}[\mathrm{D}]}$
3. $\frac{3[\mathrm{C}][\mathrm{D}]}{2[\mathrm{~A}][\mathrm{B}]}$
4. $\frac{2[\mathrm{~A}][\mathrm{B}]}{3[\mathrm{C}][\mathrm{D}]}$

## Explanation:

Equilibrium expressions are written with the products (raised to the powers of their coefficients) in the numerator and the reactants (raised to the powers of their coefficients) in the denominator.

## ChemPrin3e T09 53

Consider the reaction

$$
\mathrm{Ni}(\mathrm{CO})_{4}(\mathrm{~g}) \rightarrow \mathrm{Ni}(\mathrm{~s})+4 \mathrm{CO}(\mathrm{~g}) .
$$

If the initial concentration of $\mathrm{Ni}(\mathrm{CO})_{4}(\mathrm{~g})$ is 1.0 M , and $x$ is the equilibrium concentration of $\mathrm{CO}(\mathrm{g})$, what is the correct equilibrium relation?

1. $K_{\mathrm{c}}=\frac{x^{4}}{1.0-4 x}$
2. $K_{\mathrm{c}}=\frac{x}{1.0-\frac{x}{4}}$
3. $K_{\mathrm{c}}=\frac{x^{4}}{1.0-\frac{x}{4}}$ correct
4. $K_{\mathrm{c}}=\frac{x^{5}}{1.0-\frac{x}{4}}$
5. $K_{\mathrm{c}}=\frac{4 x}{1.0-4 x}$

## Explanation:

## Msci 170210

17:01, general, multiple choice, $>1$ min, fixed. 028
The reaction

$$
\mathrm{A}+\mathrm{B} \rightleftharpoons \mathrm{C}+2 \mathrm{D}
$$

has an equilibrium constant of $3.7 \times 10^{-3}$. Consider a reaction mixture with
$[\mathrm{A}]=2.0 \times 10^{-2} \mathrm{M}$
$[\mathrm{C}]=2.4 \times 10^{-6} \mathrm{M}$
$[\mathrm{B}]=1.7 \times 10^{-4} \mathrm{M}$
$[\mathrm{D}]=3.5 \times 10^{-3} \mathrm{M}$

Which of the following statements is definitely true?

1. The forward reaction can occur to a greater extent than the reverse reaction until equilibrium is established. correct
2. The system is at equilibrium.
3. The reverse reaction can occur to a greater extent than the forward reaction until equilibrium is established.
4. Heat will be evolved.
5. No conclusions about the system can be made without additional information.

## Explanation:

$$
\begin{aligned}
Q & =\frac{[\mathrm{C}][\mathrm{D}]^{2}}{[\mathrm{~A}][\mathrm{B}]} \\
& =\frac{\left(2.4 \times 10^{-6} \mathrm{M}\right)(0.0035 \mathrm{M})^{2}}{(0.02 \mathrm{M})(0.00017 \mathrm{M})} \\
& =8.64706 \times 10^{-6}
\end{aligned}
$$

Since $Q<K$ the foward reaction is favored.

## Msci 170616

17:04, general, multiple choice, $>1 \mathrm{~min}$, fixed. 029
Consider the system

$$
2 \mathrm{~N}_{2} \mathrm{O}_{5}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{~N}_{2} \mathrm{O}_{4}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})+\text { heat }
$$

at equilibrium at $25^{\circ} \mathrm{C}$.
If the temperature were raised would the equilibrium be shifted to produce more $\mathrm{N}_{2} \mathrm{O}_{5}$ or more $\mathrm{N}_{2} \mathrm{O}_{4}$ ?

1. more $\mathrm{N}_{2} \mathrm{O}_{5}$ correct
2. more $\mathrm{N}_{2} \mathrm{O}_{4}$
3. There would be no effect.

## Explanation:

This is an exothermic reaction and so increasing temperature provides more heat to the system, shifting equilibrium to the left and producing more $\mathrm{N}_{2} \mathrm{O}_{5}$.

## Msci 171101

17:10, general, multiple choice, $>1 \mathrm{~min}$, normal.

## 030

Calculate the equilibrium constant at $25^{\circ} \mathrm{C}$ for a reaction for which $\Delta G^{0}=-3.45 \mathrm{kcal} / \mathrm{mol}$.

## 1. 339.157 correct

2. 678.314
3. 169.578
4. -339.157
5. 3391.57

## Explanation:

$T=25^{\circ} \mathrm{C}+273=298 \mathrm{~K}$ $\Delta G^{0}=-3450 \mathrm{cal} / \mathrm{mol}$

At equilibrium

$$
\begin{aligned}
\Delta G^{0}= & -R T \ln K \\
-3450= & (-1.987 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{~K}) \\
& \times(298 \mathrm{~K})(\ln K) \\
K= & 339.157
\end{aligned}
$$
