

CH 302 Spring 2007 Worksheet 6 Key

1. You have a 750 mL solution of 0.1 M methylamine. You can't find the K_b for methylamine but notice that the K_a for its conjugate acid is 1×10^{-9} . What is the pH of the methylamine solution?

Answer: $K_w = K_a K_b = 1 \times 10^{-14}$ so $K_b = 1 \times 10^{-5}$
 $[\text{OH}^-] = (K_b C_b)^{1/2} = [(0.1)(10^{-5})]^{1/2} = 10^{-3}$
 $\text{pOH} = 3$ $\text{pH} = 14 - \text{pOH} = \underline{\underline{11}}$

2. You decide to titrate it against 1 M hydrochloric acid. When you've added 25 mL of the HCl to the solution, what is the pH?

Answer: You have 0.075 mol ammonia and 0.025 mol HCl. Neutralize:
 You end up with 0.05 mol ammonia and 0.025 mol ammonium ion (NH_4^+). This is a buffer.
 $[\text{OH}^-] = K_b (C_b / C_a) = 10^{-5} (0.05 / 0.025) = 2 \times 10^{-5}$
 $\text{pOH} = -\log(2 \times 10^{-5}) = 4.7$ $\text{pH} = 14 - 4.7 = \underline{\underline{9.3}}$

3. You continue the titration. What is the pH when you've added 75 mL HCl total? What is this point called?

Answer: You have 0.075 mol of each. Neutralize: You end up with 0.075 mol of ammonium ion. This is a weak acid.
 $[\text{H}^+] = (K_a C_a)^{1/2}$
 Remember $K_a = K_w / K_b = 10^{-14} / 10^{-5} = 10^{-9}$
 Also remember that the total volume is 75 mL + 750 mL = 775 mL
 $[\text{H}^+] = [(10^{-9})(0.075 \text{ mol} / 0.775 \text{ L})]^{1/2} = 9.8 \times 10^{-6} \text{ M}$
 $\text{pH} = -\log(9.8 \times 10^{-6}) = \underline{\underline{5.0}}$

4. You keep going until you've added 100 mL HCl. What is this final pH?

Answer: You have 0.075 mol ammonia and 0.1 mol HCl. Neutralize: You end up with 0.025 mol H^+ and 0.075 mol ammonium ion. The ammonium ions are weak; ignore them. This is a strong acid solution.
 $[\text{H}^+] = C_a = 0.025 \text{ mol} / (0.850 \text{ L}) = 0.029 \text{ M}$
 $\text{pH} = -\log(0.029 \text{ M}) = \underline{\underline{1.5}}$

5. AgCl has a K_{sp} of 1.77×10^{-10} . What is the molar solubility of AgCl?

Answer: $K_{sp} = x^2$
 $x = (K_{sp})^{1/2} = (1.77 \times 10^{-10})^{1/2} = \underline{\underline{1.33 \times 10^{-5}}}$

6. $\text{Mg}_3(\text{PO}_4)_2$ has a K_{sp} of 9.86×10^{-25} . What is the molar solubility of $\text{Mg}_3(\text{PO}_4)_2$?

Answer: $K_{sp} = (3x)^3 (2x)^2 = 10x^5$
 $x = (K_{sp} / 108)^{1/5} = (9.86 \times 10^{-25} / 108)^{1/5} = \underline{\underline{6.20 \times 10^{-6}}}$

7. Given the following compounds and K_{sp} values, rank the compounds from most to least soluble.

Compound	K_{sp}	Molar solubility	Rank
ZnS	2.0×10^{-25}	4.5×10^{-13}	2
Ag ₂ S	1.0×10^{-49}	2.9×10^{-17}	3

Fe(OH) ₃	6.3 x 10 ⁻³⁸	2.9 x 10 ⁻¹⁰	1
Fe ₂ S ₃	1.4 x 10 ⁻⁸⁸	1.1 x 10 ⁻¹⁸	4

8. You drop 0.1 g of solid NaOH in an Olympic-sized swimming pool full of pure water (volume = 2.5 x 10⁶ L). What is the pH of the pool?

Answer: Calculate C_b

$$C_b = (0.1 \text{ g} / (40 \text{ g/mol})) / (2.5 \times 10^6 \text{ L}) = 10^{-9} \text{ M}$$

If we use our approximation,

$$[\text{OH}^-] = C_b = 10^{-9}$$

But water contributes 100 times this much, so we can't ignore it.

$$[\text{OH}^-] = 10^{-9} + 10^{-7} = 1.01 \times 10^{-7}$$

$$\text{pOH} = -\log(1.01 \times 10^{-7}) = 6.996 \quad \text{pH} = 7.004$$

(Or, pH ≈ 7)

9. What if you'd dropped 10 kg of NaOH into the pool?

Answer: You drop in 100,000 times as much NaOH, C_b is 100,000 times larger.

$$C_b = 10^{-4} \text{ M}$$

Now our approximation holds.

$$[\text{OH}^-] = 10^{-4} \text{ M}$$

$$\text{pOH} = 4 \quad \text{pH} = 10$$

10. List the assumptions that must be true for us to obtain reasonably accurate answers when using equations like $[\text{H}^+] = C_a$ or $[\text{OH}^-] = (K_b C_b)^{0.5}$.

Answer: K_s are far apart—with respect to K_w it means the K_a or K_b is 1 x 10⁻¹⁰ or larger
C is large enough—with respect to water they are values greater than 10⁻⁵

11. Briefly explain the major reason that any of the above assumptions being false would invalidate our approximations.

Answer: In either case, it means that the contribution of H⁺ or OH⁻ from other species in solution is non-negligible. With respect to water it means that 10⁻⁷ M H⁺ or OH⁻ is at least 1% of the contribution to total.

12. You have a neutralization reaction, $\text{OH}^- + \text{HA} \leftrightarrow \text{H}_2\text{O} + \text{A}^-$. Given the following starting concentrations of OH⁻ and HA, give the end concentrations of OH⁻, HA, and A⁻.

- | | | | |
|----|--|-------------------------------|--------------------------------|
| a. | Initial: $[\text{OH}^-] = 0.1 \text{ M}$ | $[\text{HA}] = 1 \text{ M}$ | |
| | Final: $[\text{OH}^-] = 0 \text{ M}$ | $[\text{HA}] = 0.9 \text{ M}$ | $[\text{A}^-] = 0.1 \text{ M}$ |
| b. | Initial: $[\text{OH}^-] = 1 \text{ M}$ | $[\text{HA}] = 1 \text{ M}$ | |
| | Final: $[\text{OH}^-] = 0 \text{ M}$ | $[\text{HA}] = 0 \text{ M}$ | $[\text{A}^-] = 1 \text{ M}$ |
| c. | Initial: $[\text{OH}^-] = 1 \text{ M}$ | $[\text{HA}] = 0.1 \text{ M}$ | |
| | Final: $[\text{OH}^-] = 0.9 \text{ M}$ | $[\text{HA}] = 0 \text{ M}$ | $[\text{A}^-] = 0.1 \text{ M}$ |

Answer: Simple limiting reagent stuff. In a, OH⁻ is the limiting reagent, in b, there is no limiting reagent (or both are, however you want to look at it), and in c, HA is the limiting reagent.

- 13-19. State whether the given mixture forms a buffer (hint: you may have to neutralize first). Whether it does or not, calculate the pH. K_a for HCOOH = 10⁻⁵.

13. 1 M HCOOH and 1 M COOH⁻

Answer: This is the definition of a buffer.

$$[H^+] = K_a(C_a/C_b) = 10^{-5}(1/1) = 10^{-5}$$

$$\text{pH} = \underline{5}$$

14. 1 M HCOOH and 1 M NaOH

Answer: Neutralize. You end up with 1 M COOH⁻. This is not a buffer. It's a weak base.

$$[OH^-] = (K_b C_b)^{1/2} = [(10^{-14}/10^{-5})(1)]^{1/2}$$

$$= [10^{-9}]^{1/2} = 10^{-4.5}$$

$$\text{pOH} = 4.5 \quad \text{pH} = \underline{9.5}$$

15. 1 M HCOOH and 0.5 M NaOH

Answer: Neutralize. You end up with 0.5 M HCOOH and 0.5 M COOH⁻. This is a buffer. Notice that C_a/C_b is the same as in #13; so $\text{pH} = \underline{5}$.

16. 1 M HCl and 1 M HCOOH

Answer: This is a strong and a weak acid. This isn't a buffer. The weak acid doesn't matter.

$$[H^+] = C_a = 1 \text{ M}$$

$$\text{pH} = \underline{0}$$

17. 1 M HCl and 1 M COOH⁻

Answer: Neutralize. You end up with 1 M HCOOH. This isn't a buffer, it's a weak acid.

$$[H^+] = (K_a C_a)^{1/2} = [(10^{-5})(1)]^{1/2} = 10^{-2.5}$$

$$\text{pH} = \underline{2.5}$$

18. 1 M HCl and 5 M COOH⁻

Answer: Neutralize. You end up with 4 M COOH⁻ and 1 M HCOOH. This is a buffer.

$$[H^+] = K_a(C_a/C_b) = 10^{-5}(1/4) = 2.5 \times 10^{-6}$$

$$\text{pH} = -\log(2.5 \times 10^{-6}) = \underline{5.6}$$

19. 1 M HCl and 0.5 M COOH⁻

Answer: Neutralize. You end up with 0.5 M HCl and 0.5 M HCOOH. This is a strong acid/weak acid, not a buffer.

$$[H^+] = C_a = 0.5 \text{ M}$$

$$\text{pH} = -\log(0.5) = \underline{0.3}$$

20. Write down the five types of neutralization reactions from MEMORY

Answer:
